

Pioneer Insurance Bot — Workflow

End-to-end automation for adding / verifying patient insurance and saving prescriptions in Pioneer

What this bot does, in one paragraph. The bot logs into Pioneer, fetches the next patient from the CloudRx API, and for each prescription either confirms the correct insurance is already configured or adds/selects it before saving the Rx. It handles every standard Pioneer popup along the way and auto-recovers from the two most common save-time errors. Each patient ends with exactly one API status update — `pms_synced` , `skipped` , or `failed` .

How to read this document

- **Diagram 1** — the bot's state machine (the outer loop that drives everything).
- **Diagram 2** — how a single patient is processed end-to-end.
- **Diagram 3** — the post-save popup & recovery flow that runs after every Save & Continue.

Color key (used in every diagram)

Color	Meaning
Green	Success outcome — patient/Rx is done, API marked <code>pms_synced</code> .
Yellow	Soft skip — a single Rx was bypassed, but the rest of the patient continues.
Red	Hard failure — patient marked <code>failed</code> in the API.

Diagram 1 Top-level state machine

The bot runs as a long-lived state machine — **INIT** → **GET_DATA** → **PROCESS** → **END**. On success the cycle returns to **GET_DATA** for the next patient. The bot runs 24×7.

Diagram 2**Per-patient: insurance & Rx workflow**

For each patient, the bot opens the first prescription and follows this decision tree. If the patient is already fully configured (cardholder ID already on the Primary insurance field), the bot does nothing and skips every remaining Rx for that patient.

Decision points (Diagram 2) explained

Decision	Plain English
Dispense pre-check	"Is this patient's correct insurance already showing as Primary on the prescription?" If yes, the bot does nothing — the patient is already fully configured.
Pay Methods grid check	"Is the right insurance card already in the patient's profile?" If yes, no add is needed — the bot just selects it as Primary.
Binocular advanced search	When the insurance is missing, the bot uses Pioneer's magnifying-glass icon to look up plans by BIN/PCN — exactly like a pharmacist would.
"(P) + first word" shortcut	Pioneer's typing shortcut to switch the Primary combo. Using the first word of the plan name (e.g. (P)BCBS) is needed when the patient has multiple Primary plans on file.
Verification	After every Primary selection the bot re-reads the field and confirms the patient's cardholder ID is in it. If not, the Rx is cancelled rather than saved against the wrong insurance.

Diagram 3 Save & Continue — post-save recovery flow

Every **Save & Continue** click goes through the same checked sequence of popups. Two common non-bypassable errors are auto-fixed and retried; anything else cancels that one prescription and moves on.

Summary for stakeholders

1. **Pre-check** — if the patient's correct insurance is already selected on the Dispense tab, the bot does nothing and marks the patient `pms_synced` .
2. **Profile check** — otherwise it opens the patient's profile and either picks up the existing insurance card or adds a new one via the binocular search (BIN + PCN).
3. **Primary selection** — the bot selects the matching plan as Primary on the prescription, verifies it took, and only then runs Save & Continue.
4. **Save recovery** — the save flow handles every popup. For non-bypassable errors it auto-fixes the two common ones (third-party-setup-only and DAW) and re-saves. Other non-bypassable errors cancel that single prescription.
5. **All other Rx** — every subsequent prescription for the same patient runs the same Primary verification using the plan name captured during step 2/3.
6. **One API call** — the portal is updated exactly once per patient with `pms_synced` , `failed` , or `skipped` .

What the bot auto-recovers from during save:

- **Third-party setup errors** — bot applies the Pioneer-recommended fix and re-saves.
- **DAW (Dispense As Written) errors** — bot toggles the DAW checkbox and re-saves.

Any other non-bypassable error is treated as a real issue: the bot saves a screenshot, cancels that single prescription, and moves on.
